coding and

```
CC non-coding regions of RNAs corresponding to target genes, gene
CC initiation codons, genomic flanking regions, intron-exon borders, the
CC 5'-end, the 3'-end and the juxta-section between coding and non-coding
CC regions and all segments of RNAs encoding proteins associated with one
CC or more diseases, conditions or mixtures. The antisense oligonucleotides
CC may be derived from sequences X55272-74. These multiple target
CC oligonucleotides (specifically X55180-271) can be used for the antisense
CC are those associated with impaired respiration and inflammation,
CC are those associated with impaired respiration and inflammation,
CC are those associated with impaired respiration and inflammation,
CC allergic rhinitis, acute asthma, allergies, asthma, impeded respiration,
CC respiratory distress syndrome, pain, cystic fibrosis, pulmonary
CC hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive
CC carcinomas e.g. colon cancer, breast cancer, lung cancer, panoreatic
CC cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic
CC metastases, as well as all types of cancers which may metastasize or have
CC metastasized to the lungs, including breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match 3.1%; Score 71.2; DB 20; Best Local Similarity 32.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a gene encoding a subunit of the cellulose synthase complex of Vigna angularis. The invention relates to subunits cellulose synthetic equipment, that can be used to increase the amount cellulose synthesised by a plant. The proteins and genes encoding them can also be used to improve the properties of the cellulose being produced by a plant.

The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, remail cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    22-JUN-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            뫄
                            CC Insert. The invention provides a method for increasing the resistance CC inserting onto or into the core protein to proteolytic degradation that comprises linking or CC inserting onto or into the core protein a stabilising polypeptide of CC formula [Glya)X(Glyb)X(Glyc)Z]n where Glya, Glyb, Glyc are 1-6 CC sequential Gly residues and X, Y, Z are Ala, Ser, Val, Ile, Leu, Met, CP Phe, Pro or Thr and n can be anything between 1-66. X, Y and Z need not be identical from n repeat to n repeat. Alternatively a nucleic acid ce nocding the stabilising polypeptide can be linked onto or inserted into CC a nucleic acid encoding a core protein. The fusion proteins of the CC invention are more resistant to degradation by proteases and, thus, have CC used for treating autoimmune diseases, cancer and inflammation. In CC particular, the core protein may be an IxappaB regulator protein for the treatment of inflammatory bowel disease, or a nitroreductase protein which can activate nitro drugs in enzyme/prodrug therapy to treat cancer or other pathological conditions. The fusion proteins can also be used in Very CC diagnostic methods such as in vivo imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fusion protein; stabilising polypeptide; proteolytic degradation; resistance; half-life; autoimmune disease; inflammation; nitro drug; IkappaB regulator protein; inflammatory bowel disease; in vivo imaging; nitroreductase protein; enzyme therapy; prodrug therapy; protease; cancer; pathological condition; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                              New fusion proteins resistant to proteolytic degradation comprising a core protein with a stabilising polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              V55831 standard;

EBNA 1 protein is used to stably maintain episomes containing EBV origin of replication (orif) and a gene encoding protein or RNA of interest. Eucaryotic host cells expressing EBNA 1 protein are transfected with these episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a rapid and reliable method of stably expressing multiple genes in transfected cells. The episomes are useful in the transfection of genes encoding receptors, transporter proteins, ion channels, adhesion molecules and transcription factors. The episomes carrying desired genes can also be used to transfect cells in gene therapy, antisense therapy, for gene amplification, cell immortalisation, etc.

                                                                                                                                                                                                                                                                                                                                                         library targeted to a selected RNA transcript. The methods can be used for identifying antisense agents and for identifying target sites for antisense-mediated inhibition of a selected gene. The use of a direct library for target site selection significantly simplifies the screening process, since only very small libraries need be prepared and assayed. This sequence represents the vector pShuttle which is used in the method of the invention.

selectable marker. Polynucleotides encoding polypeptides, erythropoletin or leptin, and ribozymes and antisense polynucleotides can be inserted into the vector. The vector preferred for use in novel compositions and methods for impolynucleotide delivery into cells. In these methods, polynucleotide delivery into cells.

The vector is

such

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               agents are used to increase the frequency of uptake of a nucleic acid (see also V21684-86) into a cell. The polycationic agent can condense with the nucleic acid and inhibit serum and/or nuclease degradation of the nucleic acid. The nucleic acid can be a vector, may express a therapeutic protein or a vaccinating viral or cancer antigen, or is itself therapeutic (antisense or ribozyme). The methods and compositions can be used in the gene

The cell is used to assay a test compound for its effect on a G_iPCR. The method and cells are useful for assaying agonist and antagonist compounds, which bind to G_iPCR which, stimulate intracellular calcium mobilization, such as the nociceptin receptor, and particularly chemokine receptors such as CCR3, CCR2 and the interleukin 8 receptor type B. The present sequence represents the nucleotide sequence of the pCEP4 vector.
                                                                                                                                                                                          6659

Plasmid pCisEBON (a pRK5 derivative) is an episomal CMV driven expression plasmid. HuHGF variants with enhanced receptor binding activity were produced by site-directed mutagenesis. Stable populations of preferred HGF variants were obtained by transfecting human embryonic kidney 293 cells and then these were subcloned in pCisEBON. See R52940-R52949 for examples of pref. HGF variants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 10596

New hepatocyte growth factor variants - are resistant to in vivo proteolytic cleavage into a 2-chain form, useful as HGF antagonists

Example 1; Fig 6; 39pp; English.

This sequence represents the episomal CMV driven expression plasmid pcisEBON which was used in the expression of variant human hepatocyte growth factor HGF). HGF is isolated from human serum and is a disulphide linked heterodimer derived by proteolytic cleavage of the pro-hormone between residues 494 and 495. This generates a molecule composed of an alpha subunit tof 440 annino acids (mol. wt. 69 kD) and beta subunit of 234 amino acids (mol. wt. 34 kD). The alpha and beta subunit sare encoded by a single open reading frame. The alpha subunit contains four kringle domains based on their homology to kringle-like domains in other proteins, e.g. prothrombin, plasminogen. The beta subunit shows high homology to the catalytic domain of serine proteases. However two of the three residues which form the catalytic triad of serine proteases are not conserved in HGF. Therefore, the precise function of the beta chain remains unknown. The invention includes HGF variants which retain HGF receptor binding activity without having the biological activity of wild-type HGF. They can be used for the treatment of pathological conditions associated with the activation of a HGF receptor such as malignancies associated with chronic HGF receptor activation. The pricased for manipulation of the HGF coding sequence and expression of the variant HGF's of the invention.

/note-"Organ: kidney; Vector: pOTB7; Site_1: XhoI; Site_2: EcoRI; cDNA made by oligo-dT priming. Directionally cloned into EcoRI/XhoI sites using the following 5' adaptor: GGCACGA(G). Size-selected >500Mp for average insert size 1.8kb. Library constructed by Ling Hong in the laboratory of Gerald M. Rubin (University of California, Berkeley) using ZAP-cDNA synthesis kit (Stratagene) and Superscript II RT (Life Technologies)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AW249563 550 bp mRNA EST 07-JAN-2000 2821312.3prime NIH_MGC_7 Homo sapiens cDNA clone IMAGE:2821312 3', mRNA sequence.

                                                                                                                                                                                                                                                                                                                                                 ä
                                                                                           The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can'be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by an unclaid acid molecule (NRM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NRM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; secreted protein; expressed sequence tag; EST; haematopoiesis;

                                                                                                                                                                                                                                                                                                                                                                                                                          1064 gggaggcagaagcctgct-gcctggctgtctt-cccacccagctctcccctgcgcccc 1121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a human expressed sequence tag (EST). The polynucleotide, which is a secreted EST, and the encoded protein are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopolesis regulating activity, tissue growth activity, activin/inhibin activity, chemokinhelic activity, anti-inflammatory activity, caceptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The polynucleotide may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                         derived from
                                      New polynucleotides encoding human secreted proteins - derived e.g. human blood, kidney, foetal lung, placenta, testes, brain, ovary, pituitary, retina and colon cDNA libraries.

CILT). The basic sequence is derived from PRV strain InFh and PRV strain Ka. The LIT overlags and is transcribed in the opposite orientation with respect to the EPP (early polypeptide 0) and the immediately early gene (IE180). EPO is nonessential for replicatio. LIT is the only gene expressed during PRV latency, and the IE180 gene is absolutely necessary for PRV replication. However there are 2 copies of IE180 in the genome. It is expected that PRV lacking one 2 copies of IE180 in the genome. It is expected that PRV lacking one 2 copies of IE180 in the genome. It is expected that PRV lacking one 2 copies of IE180 in the genome. It is expected that PRV lacking one 2 copies of these is viable. Deletions in overlapping regions will generate double deletion mutants. The invention is concerned with the construction of attenuated 2 can be achieved by functionally disabiling the expression of the EPO 2 cypen. Can be disrupting the synthesis of the LLT, or both.                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents a fragment of the genomic sequence containing the coding region for the mouse WRN gene (X83004). The corresponding human gene (X83001) encodes a protein related to Werner's syndrome. The products can be used for the detection and treatment of Werner's syndrome (WS), an autosomal recessive disorder with a complex phenotype,

                                                                                                                                                                                                                                                                               This sequence is a fragment of the Kaposi's sarcoma-associated herpesvirus (KSHV) LUR (long unique region). This fragment contains coding regions for ORF65 which encodes capsid protein IV, ORF66, ORF67 which encodes tegument protein IV, ORF68 which encodes a glycoprotein, ORF69, K12 which encodes immediate early protein (IEP), K14 which encodes cyclin D, ORF73 which encodes immediate early protein (IEP), K14 which encodes ov.2 (v.adh), ORF74 which encodes G-protein coupled receptor, ORF75 which encodes tegument protein/FGART, K15. KSHV is a new human Herpesvirus (HHV8) believed to cause Kaposi's sarcoma (KS) which is the most common form of neoplasm occurring in persons with acquired immune deficiency syndrome (AIDS). The DHFR protein is useful for vaccination, prophylaxis, diagnosis and treatment of a subject with Kaposi's sarcoma and for detecting expression of a DNA virus associated with Kaposi's

/product- telomerase protein p105

```
This sequence represents the long unique region and terminal repeat of the Kaposi's sarcoma-associated herpes virus (KSHV). KSHV is also known cas human herpes virus 8 (HHV8). This sequence contains the DNAs of the invention which encode KSHV polypeptides selected from: (a) viral complement-binding protein; glycoproteins B, M or L; (d) capsid protein IV encoded by ORF65, and (e) immediate early protein carcoded by ORF73. Labelled probes for the nucleic acid, proteins encoded by it, and antibodies (Ab) specific for the proteins are useful for detecting HHV8. specifically for diagnosis of Kaposi's sarcoma, in body fluids or tissue samples. HHV8 infections can be treated with antisense or triplex forming molecules or agents that bind specifically to the protein. Ab may be used for prophylaxis or treatment of HHV8 infection, while the protein can be used in protective vaccines. Ab may also be used to differentiate between lymphomas, and HHV8 may be implicated in many other lymphoproliferative diseases such as lymphomas, leukaemia, splenomagaly and mycosis fungacides. Cells and animals containing the coules of a patient infected with HHV9. HHV8 derived peptides can be used as targets for antiviral drugs e.g. dihydrofolate reductase gene can be inhibited with methotreake. These can also be used to determine the immune status of a patient infected with HHV9. HHV8 derived protein containing the manner of the immune status of a patient infected with HHV9. HHV8 derived protein containing the election of a patient infected with HHV9. HHV8 derived protein containing the election and a patient infected with HHV9. HHV8 derived protein containing the election of a patient infected with HHV9. HHV8 derived protein containing the election of a patient infected with HHV9. HHV8 derived protein containing the mach as an anti-inflammatory agent for,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Db 126220 GGATGACGAGGAGGATGACGAGGAGGATGACGAGGAGGATGACGAGGAGGATGACGAGGA 126161

```
The sequence is that of a human telomerase protein coding sequence codon-optimized for mammalian cell expression. The sequence, or specific fragments of it, can be used to modulate expression of a telomerase transcript (by hybridising to it intracellularly), e.g. telomerase transcript (by hybridising to it intracellularly), e.g. for treatment or prevention of cancer, restenosis, inflammation, myocardial infarction, glomerulonephritis, transplant rejection and infections (e.g. with human immunodeficiency virus). It can be used to express recombinant telomerase protein which can be used to screen for agents, e.g. antibodies, that modulate binding of human telomerase cotis binding target. Those that inhibit telomerase activity can be used to treat the conditions listed above, while those that are used to treat the conditions listed above, while those that are used to treat the conditions listed above, while those that are compliant proteins lower at some season of hypersensitivity or atrophy, also to improve production of recombinant proteins by maximising cells density and survival and expansion of precursor cells being used for bone marrow transplants.

They may also be used for diagnosis. other uses of telomerase proteins are isolation, enrichment and concentration of telomerase RNA or proteins; as immunogens; in therapy; as reagent where nascent oligonachecities of known structure are needed (e.g. for tagging native nucleic acid molecules) and for regulating cell growth/density colerance. The agents and the telomerase proteins should be very expectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               836

```
This polynucleotide comprises a synthetic RNA sequence coding for the p105 subunit (see W45593) of human telomerase and optimised for expression in mammalian cells. It is based on an isolated conx expression in mammalian cells. It is based on an isolated conx colone (see V05369) for p105. The invention provides methods relating to human telomerase and related nucleic acids, including the subunit proteins p140, p105, p48 and p43. The proteins may be produced recombinantly from transformed host cells or purified from human cells. Also included are human telomerase RNA (see V05373) and functional derivatives (see V05374 and V16092-93), as well as p105 synthetic DNA sequences (V05370-72). The invention also provides isolated telomerase hybridisation probes and primers capable of specifically hybridising with the telomerase gene, telomerase specific binding agents such as specific antibodies, and methods of making and using the subject compositions in diagnosis (e.g. gene therapy to modulate telomerase transcripts), therapy (e.g. gene therapy to modulate telomerase transcripts), therapy chemical libraries for lead agents). Modulation of telomerase expression can be used for the treatment or prevention of cancer, expression can be used for the treatment or prevention of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid encoding human telomerase proteins or their fragments - useful for therapeutic modulation of telomerase activity and for screening for potential modulators of telomerase-target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  myocardial infarction, glomerulonephritis

```
the coding region for the mouse WRN gene (x83004). The corresponding human gene (x83001) encodes a protein related to Werner's syndrome. The products can be used for the detection and treatment of Werner's syndrome (WS), an autosomal recessive disorder with a complex phenotype,

```
The sequence is that of an example randomising oligonucleotide which is used in the prepn. of mRNA encoding candidate polypeptides for the method of systematic polypeptide evolution by reverse translation (SPERT). The method provides a rapid way of isolating and identifying polypeptide ligands which bind to target mols. The polypeptide ligands can be used in e.g. assay methods, diagnostic procedures, cell sorting, as activators or inhibitors of target mol. function, as probes, as sequestering agents, drug delivery vehicles, modififers of hormone

of the epitope commonly recognised by the antisers from autoimmune mice which are the fl progeny of a cross of N2B and N3W parents (Portanova et al., J. Immunol. 144, 4633, 1990). The known epitope consists of ca. 10 aniho acids at the N-terminus of the histone H2B protein. To make mRNA encoding candidate polypeptides a 5' fixed sequence composed of a 77 promoter sequence and a ribosome binding site which is recognised by both prokaryotic and eukaryotic ribosomes, terminating in a restriction endonuclease site is synthesised and cloned using a number of oligonucleotides (example shown). A 3' fixed sequence is placed into a restriction site to provide an mRNA encoding the C terminal trailer sequence of ca. 100 nucleotides lacking stop codons. In addition, a' primer annealing site is provided so that CDNA synthesis can be accomplished on the mRNA recovered from partitioned ribosome complexes. See also Q36845-63.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            50 gncgactccacctgggaggaggacgaggaggatgcggaggacgcggaggacgaggactgc 109

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This cDNA sequence includes a coding region for human prostate protein HPA8 (see W23322), an immunogenic portion of which can be used in a claimed pharmaceutical composition for the treatment of prostate cancer, in a claimed vaccine for treatment of prostate cancer, or to raise claimed antibodies suitable for use in claimed state and antibodies suitable for use in diagnosis or monitoring the progression of prostate cancer. HPA8 cDNA was isolated from a human prostate adenocarchnoma cell line LnCap.igc (ATCC CRL-1740) cell cDNA library by expression screening with human prostatitis sera. DNA sequences (see T84927-52) for I7 HPA proteins (see W2313-23 and W27303-07) are provided and can be used to produce recombinant HPA polypeptides in host cells

( Particularly E. coli, yeast and mammalian cell lines) and to design primers and probes for use in claimed methods of detecting

The present sequence encodes a polypeptide obtained from prostate tumour cells. The polypeptide comprises an immunogenic portion of a prostate protein. The polypeptides and DNA obtained from prostate tumour cells, as well as antibodies raised against the protein, can be used in the treatment, diagnosis and monitoring of prostate
